(54) Title: N-(SUBSTITUTED BENZYL)-8-HYDROXY-1,6-NAPHTHYRIDINE-7-CARBOXAMIDES USEFUL AS HIV INTEGRASE INHIBITORS

(57) Abstract: N-(Substituted benzyl)-8-hydroxy-1,6-naphthyridine-7-carboxamides are inhibitors of HIV integrase and inhibitors of HIV replication. The naphthyridine carboxamides are of Formula (I): (I), wherein R1', R2' and R3' are defined herein. The compounds are useful in the prevention and treatment of infection by HIV and in the prevention, delay in the onset, and treatment of AIDS. The compounds are employed against HIV infection and AIDS as compounds per se or in the form of pharmaceutically acceptable salts. The

compounds and their salts can be employed as ingredients in pharmaceutical compositions, optionally in combination with other antivirals, immunomodulators, antibiotics or vaccines. Methods of preventing, treating or delaying the onset of AIDS and methods of preventing or treating infection by HIV are described.

TITLE OF THE INVENTION

N-(SUBSTITUTED BENZYL)-8-HYDROXY-1,6-NAPHTHYRIDINE-7-CARBOXAMIDES USEFUL AS HIV INTEGRASE INHIBITORS

5 This application claims the benefit of U.S. Provisional Application No. 60/364,929, filed March 15, 2002, the disclosure of which is hereby incorporated by reference in its entirety.

FIELD OF THE INVENTION

10 The present invention is directed to N-(substituted benzyl)-8-hydroxy-1,6-naphthyridine-7-carboxamides and pharmaceutically acceptable salts thereof, their synthesis, and their use as inhibitors of the HIV integrase enzyme. The compounds of the present invention and their pharmaceutically acceptable salts are useful for preventing or treating infection by HIV and for treating, delaying the onset of, or
15 preventing AIDS.

BACKGROUND OF THE INVENTION

 A retrovirus designated human immunodeficiency virus (HIV) is the etiological agent of the complex disease that includes progressive destruction
20 of the immune system (acquired immune deficiency syndrome; AIDS) and degeneration of the central and peripheral nervous system. This virus was previously known as LAV, HTLV-III, or ARV. A common feature of retrovirus replication is the insertion by virally-encoded integrase of proviral DNA into the host cell genome, a required step in HIV replication in human T-lymphoid and
25 monocytoid cells. Integration is believed to be mediated by integrase in three steps: assembly of a stable nucleoprotein complex with viral DNA sequences; cleavage of two nucleotides from the 3' termini of the linear proviral DNA; covalent joining of the recessed 3' OH termini of the proviral DNA at a staggered cut made at the host target site. The fourth step in the process, repair synthesis of
30 the resultant gap, may be accomplished by cellular enzymes.

 Nucleotide sequencing of HIV shows the presence of a pol gene in one open reading frame [Ratner et al., *Nature* 1985, 313: 277]. Amino acid sequence homology provides evidence that the pol sequence encodes reverse transcriptase, integrase and an HIV protease [Toh et al., *EMBO J.* 1985, 4: 1267;

Power et al., *Science* 1986, 231: 1567; Pearl et al., *Nature* 1987, 329: 351]. All three enzymes have been shown to be essential for the replication of HIV.

It is known that some antiviral compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS and similar diseases, including reverse transcriptase inhibitors such as azidothymidine (AZT) and efavirenz and protease inhibitors such as indinavir and nelfinavir. The compounds of this invention are inhibitors of HIV integrase and inhibitors of HIV replication. The inhibition of integrase in vitro and of HIV replication in cells is a direct result of inhibiting the strand transfer reaction catalyzed by the recombinant integrase in vitro in HIV infected cells. A particular advantage of the present invention is highly specific inhibition of HIV integrase and HIV replication.

SUMMARY OF THE INVENTION

The present invention is directed to certain N-(substituted benzyl)-8-hydroxy-1,6-naphthyridine-7-carboxamides. These compounds are useful in the inhibition of HIV integrase, the prevention of infection by HIV, the treatment of infection by HIV and in the prevention, treatment, and delay in the onset of AIDS and/or ARC, either as compounds or their pharmaceutically acceptable salts, or as pharmaceutical composition ingredients, whether or not in combination with other HIV/AIDS antivirals, anti-infectives, immunomodulators, antibiotics or vaccines. The compounds of the invention have one or more polar ortho substituents in the benzyl ring. The compounds can have improved potency against replication of HIV in cells relative to similar N-(benzyl)-8-hydroxy-1,6-naphthyridine carboxamides

which either have no ortho substituents on the benzyl ring or have non-polar or less polar ortho substituents.

Various embodiments, aspects and features of the present invention are either further described in or will be apparent from the ensuing description, examples and appended claims.

DETAILED DESCRIPTION OF THE INVENTION

The present invention is directed to certain N-(substituted benzyl)-8-hydroxy-1,6-naphthyridine-7-carboxamide compounds. These compounds and pharmaceutically acceptable salts thereof are HIV integrase inhibitors. The compounds of the present invention are characterized by having at least one ortho polar substituent (e.g., -C(=O)N(alkyl)₂, -C(=O)NH(alkyl), -alkylene-C(=O)N(alkyl)₂, or -alkylene-C(=O)NH(alkyl)) on the benzyl ring. The compounds of the invention can have improved cell potency (i.e., antiviral potency as determined, for example, via an assay to measure inhibition of HIV replication), particularly in the presence of human serum, relative to similar N-benzyl-8-hydroxy-1,6-naphthyridine carboxamide HIV integrase inhibitors that do not have an ortho polar substituent or have non-polar or less polar ortho substituents.

10 The symbol " ~~~ " in front of an open bond in the structural formula of a group marks the point of attachment of the group to the rest of the molecule.

The compounds of the present invention may have asymmetric centers and may occur, except when specifically noted, as mixtures of stereoisomers or as individual diastereomers, or enantiomers, with all isomeric forms being included in
15 the present invention.

The compounds of the present invention are useful in the inhibition of HIV integrase, the prevention or treatment of infection by human immunodeficiency virus (HIV) and the prevention, treatment or the delay in the onset of consequent pathological conditions such as AIDS. Preventing AIDS, treating AIDS, delaying the
20 onset of AIDS, or preventing or treating infection by HIV is defined as including, but not limited to, treatment of a wide range of states of HIV infection: AIDS, ARC (AIDS related complex), both symptomatic and asymptomatic, and actual or potential exposure to HIV. For example, the compounds of this invention are useful in treating infection by HIV after suspected past exposure to HIV by such means as blood
25 transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery.

The compounds of this invention are useful in the preparation and execution of screening assays for antiviral compounds. For example, the compounds of this invention are useful for isolating enzyme mutants, which are excellent
30 screening tools for more powerful antiviral compounds. Furthermore, the compounds of this invention are useful in establishing or determining the binding site of other antivirals to HIV integrase, e.g., by competitive inhibition. Thus the compounds of this invention are commercial products to be sold for these purposes.

The compounds of the present invention can be administered in the form of pharmaceutically acceptable salts. The term "pharmaceutically acceptable salt" refers to a salt which possesses the effectiveness of the parent compound and which is not biologically or otherwise undesirable (e.g., is neither toxic nor otherwise deleterious to the recipient thereof). Suitable salts include acid addition salts which may, for example, be formed by mixing a solution of the compound of the present invention with a solution of a pharmaceutically acceptable acid such as hydrochloric acid, sulfuric acid, acetic acid, trifluoroacetic acid, or benzoic acid. When the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof can include alkali metal salts (e.g., sodium or potassium salts), alkaline earth metal salts (e.g., calcium or magnesium salts), and salts formed with suitable organic ligands such as quaternary ammonium salts. Also, in the case of an acid (-COOH) or alcohol group being present, pharmaceutically acceptable esters can be employed to modify the solubility or hydrolysis characteristics of the compound.

For the purpose of preventing or treating HIV infection or preventing, treating or delaying the onset of AIDS, the compounds of the present invention can be administered orally, parenterally (including subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques), by inhalation spray, or rectally, in the form of a unit dosage of a pharmaceutical composition containing a therapeutically effective amount of the compound and conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles.

The term "administration" and variants thereof (e.g., "administering" a compound) in reference to a compound of the invention mean providing the compound to the individual in need of treatment. When a compound of the invention is provided in combination with one or more other active agents (e.g., antiviral agents useful for treating HIV infection or AIDS), "administration" and its variants are each understood to include concurrent and sequential provision of the compound and other agents.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combining the specified ingredients in the specified amounts.

By "pharmaceutically acceptable" is meant that the ingredients of the pharmaceutical composition must be compatible with each other and not deleterious to the recipient thereof.

The term "subject" (which may be alternatively referred to herein as "patient") as used herein refers to an animal, preferably a mammal, most preferably a human, who has been the object of treatment, observation or experiment.

The term "therapeutically effective amount" as used herein means that
5 amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue, system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease being treated. The term also includes a prophylactically effective amount suitable for prevention of the disease or condition.
10 When the active compound (i.e., active ingredient) is administered as the salt, references to the amount of active ingredient are to the free acid or free base form of the compound.

The pharmaceutical compositions can be in the form of orally-administrable suspensions or tablets or capsules, nasal sprays, sterile injectible
15 preparations, for example, as sterile injectible aqueous or oleagenous suspensions or suppositories. These compositions can be prepared by methods and contain excipients which are well known in the art. Suitable methods and ingredients are described in Remington's Pharmaceutical Sciences, 18th edition, edited by A. R. Gennaro, Mack Publishing Co., 1990, which is herein incorporated by reference in its
20 entirety. In one embodiment, the pharmaceutical composition is a capsule or a tablet suitable for oral administration comprising a compound of the present invention (e.g., Compound A or a salt thereof) and a nonionic surfactant (e.g., a poloxamer).

The compounds of this invention can be administered orally in a dosage range of 0.001 to 1000 mg/kg of mammal (e.g., human) body weight per day
25 in a single dose or in divided doses. One preferred dosage range is 0.01 to 500 mg/kg body weight per day orally in a single dose or in divided doses. Another preferred dosage range is 0.1 to 100 mg/kg body weight orally in single or divided doses. For oral administration, the compositions can be provided in the form of tablets or capsules containing 1.0 to 500 milligrams of the active ingredient, particularly 1, 5,
30 10, 15, 20, 25, 50, 75, 100, 150, 200, 250, 300, 400, and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound,
35 the age, body weight, general health, sex, diet, mode and time of administration, rate

of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy. A suitable dosage range for oral administration of Compound A to humans is in a range of from about 25 mg to about 1000 mg per day (e.g., from about 100 mg to about 800 mg per patient once per day).

- 5 As noted above, the present invention is also directed to use of the HIV integrase inhibitor compounds of the present invention with one or more agents useful in the treatment of HIV infection or AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of one or more of the
- 10 HIV/AIDS antivirals, immunomodulators, antiinfectives, or vaccines useful for treating HIV infection or AIDS. Suitable agents include the antiviral agents listed in the following Table:

The compounds of the present invention can be readily prepared according to the following reaction schemes and examples, or modifications thereof, using readily available starting materials, reagents and conventional synthesis procedures. In these reactions, it is also possible to make use of variants which are themselves known to those of ordinary skill in this art, but are not mentioned in

35

greater detail. Furthermore, other methods for preparing compounds of the invention will be readily apparent to the person of ordinary skill in the art in light of the following reaction schemes and examples. Unless otherwise indicated, all variables are as defined above.

- 5 The compounds of the present invention can be prepared by the coupling of suitable 1,6-naphthyridine-7-carboxylic acids (or acid derivatives such as acid halides or esters) with the appropriate benzylamines. Scheme 1 depicts the coupling reaction to obtain compounds of Formula (I).

10 SCHEME 1

- Methods for coupling carboxylic acids with amines to form carboxamides are well known in the art. Suitable methods are described, for example,
- 15 in Jerry March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, pp. 370-376, or in M. Bodanszky, The Practice of Peptide Synthesis, Springer-Verlag, 1984. Amines of formula 1-1 can be prepared, for example, by the reaction of a suitable benzyl halide with ammonia, by conversion of a suitable benzyl halide with hexamethylenetetramine, by treating the halide with potassium phthalimide and
- 20 hydrolyzing the product, and by converting a benzyl halide to an azide and then

reducing the azide to an amine; which methods are described, for example, in Jerry March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, pp. 364-365, 366, 377-378, 380, and 1106. Amines of formula 1-1 can also be prepared using, for example, the methods described in Richard Larock, Comprehensive Organic

5 Transformations, 2nd edition, Wiley-VCH Publishers Inc, 1999, pp 753-879, or routine variations thereof. Naphthyridine carboxylic acids of formula 1-2 can be prepared using methods described in Ochiai et al., *Chem.Ber.* 1937, 70: 2018, 2023; and Albert et al., *J.Chem.Soc.* 1952, 4985, 4991; or routine variations thereof. The schemes set forth below illustrate and expand upon the chemistry portrayed in Scheme 1.

10 Scheme 1A depicts a method for preparing benzylamine reactants having at least one ortho-aminocarbonyl group on the benzyl ring. Substituted toluene 1A-1 is functionalized on the methyl group via radical bromination to give the bromide 1A-2. Radical brominations are well known in the art and are described, for example, in J. March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons,

15 1985, p. 625. The azide 1A-3 can then be obtained by displacement of the bromide with azide (see J. March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, p. 380), followed by reduction of the azide using triphenylphosphine and water to afford the amine 1A-4. Similar reductions are described in *Tetrahedron* 2000, 56(52): 10175-10184; in *J. Am. Chem. Soc.* 2001, 123(5): 875-885; and in

20 Zhou, *Tett Lett.* 1999, 40: 2729. Following protection of the amino group on 1A-4 using BOC, the iodide can be transformed into the carboxyamide 1A-6 through a palladium-catalyzed carbonylation reaction in the presence of a suitable amine, in a manner similar to that described in G. Ortar, *Tett. Lett.* 1986, 27: 3931. Following removal of the BOC group, amine 1A-7 can be coupled to a suitable naphthyridine

25 carboxylic acid, e.g., with EDC and HOAt in the presence of a suitable base such as triethylamine.

SCHEME 1A

5

In Scheme 2, following the procedure set forth in Ornstein et al., *J. Med. Chem.* 1989, 32: 827-833, quinolinic anhydride 2-1 can be opened with isopropanol to provide mono acid 2-2, which can be converted to the corresponding acyl chloride 2-3 (e.g., by refluxing thionyl chloride). Acyl chloride 2-3 can then be reduced (e.g., with NaBH_4 or LiBH_4) to the corresponding alcohol 2-4, which can be converted to the corresponding bromide through the action of bromine in the presence of triphenylphosphine. Alkylation of the bromide with the sodium anion of phenylsulfonamide 2-5 in a polar aprotic solvent like DMF can provide sulfonamide 2-6, which can be treated with a base (e.g., alkali metal alkoxide such as sodium

10

methoxide) to provide the bicyclic ester **2-7** via a Dieckmann cyclization.

Saponification of the ester (e.g., with aqueous NaOH at reflux) will afford the acid **2-8**. The acid **2-8** can be activated with triphosgene and coupled with a variety of benzylamines to provide the compounds of the invention **2-9**.

5 The starting anhydrides of formula **2-1** can be prepared via methods described in Philips et al., *Justus Liebigs Ann. Chem.* 1895, 288: 2535; Bernthsen et al., *Chem. Ber.* 1887; 20: 1209; Bly et al., *J. Org. Chem.* 1964, 29: 2128-2135; and Krapcho et al., *J. Heterocycl. Chem.* 1993, 30: 1597-1606; or routine variations thereof.

10

SCHEME 2

15

Scheme 3 depicts an alternative synthesis in which alcohol 2-4 can undergo the Mitsunobu reaction with the phenylsulfonamide of glycine methyl ester to provide 3-1. The sulfonamide 3-1 can again be elaborated to provide the acid 2-8, which can be coupled with a variety of amines using standard reagents to provide the compounds of the invention 2-9.

SCHEME 3

Scheme 3A depicts a variation of the synthesis shown in Scheme 3, wherein the acid 3A-2 is reacted with ethyl chloroformate to form the mixed anhydride 3A-3, which is reduced to alcohol 3A-4. Alcohol 3A-4 can undergo the Mitsunobu reaction with methyl tosylglycine to form the ester 3A-5, which under treatment with base cyclizes to form the 1,6-naphthyridine 3A-6. Bromination then yields the bromoester 3A-7, which can be employed to prepare compounds of the invention.

Scheme 3A

- The preparation of compounds that feature additional substituents can be achieved in accordance with Scheme 4. Oxidation of the alcohol 2-4 with manganese dioxide in an inert solvent such as methylene chloride will provide aldehyde 4-1. The addition of Grignard reagents (such as phenyl magnesium bromide) to aldehyde moiety 4-1 can occur regioselectively to provide the alcohol 4-2, which can then be elaborated to the compounds of the invention 4-6.

SCHEME 4

Compounds of the invention that comprise an amino substituent at the 5 position can be prepared in the manner set forth in Scheme 5. Bromination of the phenol 5-1 occurs regioselectively upon treatment with NBS in an inert solvent like methylene chloride to afford 5-2. Reaction of this bromide with an amine at elevated temperatures in the presence of a polar solvent such as DMPU affords compounds of the invention 5-3.

SCHEME 5

- Preparation of compounds of the invention substituted with a
- 5 sulfonamide can be prepared according to Scheme 6. The preparation includes halogenation of alkyl 8-hydroxy-naphthyridine carboxylate **6-1** with a halogenation agent such as N-bromosuccinimide, and then condensing the 5-halo-8-hydroxy-naphthyridine carboxylic ester **6-2** with sulfonamide **6-3** at elevated temperature (e.g., about 120 °C) in the presence of a copper promoter (e.g., copper(I) oxide) to afford
- 10 sulfonamidonaphthyridine **6-4**. The 7-position ester can then be hydrolyzed and the benzylamine portion attached through standard amide bond formation methods to give desired product **6-6**.

SCHEME 6

5

Scheme 7 shows a method for preparing compounds of the invention in which the benzylamine moiety has either an ortho-substituted amino-2-oxoethyl group or an ortho-substituted aminocarbonyl group. In this scheme, amine 7-1 is coupled with a suitable naphthyridine carboxylic acid under standard EDC /HOAt coupling conditions in the presence of a suitable base (e.g., NMM) to afford amide product 7-2.

10

The resulting ester can then be hydrolyzed to the acid which can then be coupled with a suitable amine.

SCHEME 7

5

Scheme 8 describes the preparation of compounds having an aminocarboxy group at the 5-position of the naphthyridine ring. In this scheme, the brominated naphthyridine 8-1 is treated with carbon monoxide and methanol under palladium catalysis utilizing 1,1'-bis(diphenylphosphino)ferrocene as a ligand, using conditions similar to those described in Ortar, *Tett. Letters* 1986, 27 (33): 3931, to afford acylated naphthyridine 8-2. Removal of the tosyl protecting group with sodium methoxide in an alcholic solvent (e.g., trifluoroethanol) affords the dimethyl dicarboxylate 8-3, which can be selectively hydrolyzed under aqueous base conditions (e.g., as described in Jerry March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, pp. 334-338) to the carboxylic acid 8-4. The amide 8-5 can then be obtained from 8-4 with conventional amide coupling reagents like BOP or EDC in the presence of excess amine. The 7-position ester can then be hydrolyzed with aqueous base to afford the acid 8-6, which can then be coupled with a suitable benzylamine to give 8-7.

SCHEME 8

- Compounds of the invention that comprise an amide substituent at the 5-position of the naphthyridine can also be prepared in the manner set forth in Scheme 9.
- 5 The brominated naphthyridine ester 9-1 prepared as described in Scheme 17 can be hydrolyzed to the acid and coupled using standard reagents to an appropriately substituted amine to give 9-3. Protection of the phenolic oxygen with a tosyl group under standard conditions gives the bromide 9-4, which can then react with carbon monoxide and methanol under palladium catalysis as described for Scheme 19 to
- 10 afford the ester 9-5. This material can then be treated with base to remove the protecting group and elaborated under standard conditions to compounds of the invention 9-7.

SCHEME 9

In the processes for preparing compounds and intermediates of the present invention as set forth in the foregoing schemes, functional groups in various moieties and substituents may be sensitive or reactive under the reaction conditions employed and/or in the presence of the reagents employed. Such sensitivity/reactivity can interfere with the progress of the desired reaction to reduce the yield of the desired product, or possibly even preclude its formation. Accordingly, it may be necessary or desirable to protect sensitive or reactive groups on any of the molecules concerned.

Protection can be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973 and in T.W. Greene & P.G.M. Wuts, Protective Groups in Organic Synthesis, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known in the art. Alternatively the interfering group can be introduced into the molecule subsequent to the reaction step of concern. For example, if either of substituents R¹' and R²' in amine 1-1 can interfere with the coupling reaction between reactants 1-1 and 1-2 of Scheme 1, the substituent can be incorporated into the molecule in a post-coupling step. Scheme 7 above illustrates the post-coupling introduction of an amide-containing substituent on the benzyl ring.

Further description of methods suitable for use (either directly or via routine modification) in preparing compounds of the present invention can be found in WO 02/30930 and in US _____, which is published U.S. Application Serial No. 09/973,853, filed October 10, 2001, the disclosure of which is incorporated herein by reference in its entirety.

The following examples serve only to illustrate the invention and its practice. The examples are not to be construed as limitations on the scope or spirit of the invention.

The 3-bromopropylamine-HBr salt (**2**) and THF (43 L) were placed in a 72 L round-bottomed-flask under N₂ and the resulting slurry was cooled to 0 °C. Two dropping funnels were fitted to the flask. One was charged with the TEA and the other with a solution of the MsCl (**1**) and THF (4 L). The contents of the addition funnels were added at roughly the same rate (the TEA was added slightly faster than the MsCl) while maintaining an internal reaction temperature below 10 °C. The addition required 2 h. The resulting white suspension was warmed to 23 °C and aged for 1 h. The suspended solids (a mixture of TEA-HBr and TEA-HCl) were removed by filtration through a dry frit. The cake was washed with THF (8 L). The combined filtrate and cake-rinse, a THF solution of **3**, was collected in a 100 L round-bottomed-flask under N₂. To the solution of **3** was added the 1,10-phenanthroline and the DIPA and the resulting solution was cooled to -30 °C. The *n*-BuLi was added over about 4 h maintaining the internal temperature below -20 °C. After 1.25 eq of the *n*-BuLi was added the reaction mixture became deep brown and the color remained as the addition was completed. The reaction mixture was warmed to 0 °C over 3 h. A small aliquot was removed, and partitioned between saturated NH₄Cl and EtOAc. The EtOAc was evaporated and the residue examined by ¹H NMR to confirm consumption of **3** and conversion to **4**. To the reaction mixture at 0 °C was added saturated aqueous NH₄Cl (12 L, the first 1L slowly, a heat kick to 6 °C was observed) and then brine (12 L). The phases were partitioned and the aqueous phase was extracted with EtOAc (20 L). The organic phases were combined, washed with brine (4 L) and then concentrated under vacuum to about 12 L. The solvent was switched to EtOAc (20 L used) maintaining a volume of 12 L. After the solvent switch, a yellow slurry resulted. *n*-Heptane (20 L) was added with stirring and the slurry was cooled to 5 °C. After a 1h age the solids were collected on a frit and rinsed with cold (5 °C) 3:5 EtOAc/*n*-

heptane. The wet cake was dried for 24 h under a stream of dry N₂ to provide 1.44 kg (53% from 2) of sultam 4 as a crystalline yellow solid.

Step 2: 5-Bromo-8-(4-toluenesulfonyloxy)-1,6-naphthyridin-7-carboxylic acid methyl ester

Triethylamine (0.759 g, 7.50 mmol) was added to a suspension of 5-bromo-8-hydroxy-1,6-naphthyridine-7-carboxylic acid methyl ester (6, 1.415 g, 5.000 mmol) in chloroform (5 mL) over 5 min maintaining the temperature at 20-50 °C to give a yellow suspension. *p*-Toluenesulfonyl chloride (1.15 g, 6.00 mmol) was added over 5 min maintaining the temperature at 20-40 °C to give a yellow solution. The brown suspension became a dark red solution with a small amount of undissolved copper (I) oxide remaining (HPLC analysis indicated <0.5% starting material remaining). The mixture was diluted with chloroform (10 mL), Solkaflor (200 mg) was added and the resulting mixture was filtered through a plug of Solkaflor. The plug was washed with chloroform (10 mL) and the combined filtrates were stirred vigorously with a solution of EDTA disodium salt dihydrate (3.8 g, 10.2 mmol) in water (40 mL) while air was slowly bubbled in for 40 min. The upper aqueous phase became turquoise while the lower organic phase became yellow. The organic phase was washed with a solution of EDTA disodium salt (1.9 g, 5.1 mmol) in water (30 mL) and a solution of sodium bisulfate monohydrate (0.87g, 6.3 mmol) in water (30 mL). Each of the above three aqueous phases was back extracted sequentially with one portion of chloroform (15 mL). The organic phases were dried over sodium sulfate and filtered. The dried organic extracts were concentrated and solvent switched to a final volume of 15 mL MeOH using a total of 30 mL MeOH for the switch at atmospheric pressure. The resulting yellow homogenous mixture was heated to 50 °C and aged for 5 min (HPLC analysis indicated <0.5% starting material remaining). Mixture was cooled to 25 °C over 15 min and aged at 25 °C for

After one hour water (3.03 mL, 168 mmol) was added and the solution was heated to 55°C for one hour. The reaction was cooled and the solution was concentrated to about 10 mL *in vacuo*. The residue was purified in two runs by preparative HPLC (Gilson semi preparative HPLC system using a Waters Delta pak column (3(10x40 mm I.D.) cartridges, C18, 15 μM pore size) eluting with 95-5% water (0.025% TFA) / acetonitrile (0.025% TFA) at 45 mL/min) to give the desired product in 75% purity. EXAMPLE 3A

Preparation of {4-Fluoro-2-[(methyamino)carbonyl]phenyl}methanaminium chlorideStep 1: Methyl 2-(bromomethyl)-5-fluorobenzoate

10

With no precautions to maintain a dry atmosphere, methyl 5-fluoro-2-methylbenzoate (Maybridge, 5g, 29.7 mmole) was dissolved in CCl_4 (50 mL). N-bromosuccinimide (5.82g, 32.7 mmol) and benzoyl peroxide (0.36g, 1.48 mmole) were added and the reaction brought to reflux overnight. An additional 0.3 eq of NBS and 0.01 eq of benzoyl peroxide was added and the reaction refluxed for 4 hrs, then

15

cooled, filtered and concentrated. The residue was chromatographed on silica eluting with a gradient of 0-10% EtOAc/Hexanes. The fractions were collected to give the product, which was a mixture of mono and bis-brominated materials, as a clear oil.

1H NMR ($CDCl_3$, 400 MHz, major product peaks) δ 7.67 (1H, dd, $J = 2.8, 9$ Hz), 7.45 (1H, dd, $J = 5.4, 9$ Hz), 7.20 (1H, m), 4.93 (2H, s), 3.95 (3H, s) ppm.

20

Step 2: Methyl 2-[[bis(*tert*-butoxycarbonyl)amino]methyl]-5-fluorobenzoate

25

In a dry flask under nitrogen, di-*tert*-butyl iminodicarboxylate (Aldrich, 3.86g, 17.8 mmol) was dissolved in dry DMF (5 mL) and treated with NaH (60% dispersion in oil, 0.71g, 17.8 mmol). After the evolution of gas had ceased, Methyl 2-(bromomethyl)-5-fluorobenzoate (4g, 16.2 mmole) dissolved in DMF (5 mL) was

added. An additional 5 mL of DMF was added to aid stirring. The reaction was stirred for 2 hrs, then partitioned between water and EtOAc. The organic layer was dried with Na₂SO₄, filtered and concentrated and the residue was purified on silica eluting first with toluene, then with a gradient of 0-5% MeOH/CHCl₃. The impure product thus obtained was re-chromatographed on silica eluting with a gradient of 0-30% EtOAc/Hexanes. The product was obtained as a clear oil.

¹H NMR (DMSO, 400 MHz, major product peaks) δ 7.63 (1H, dd, *J* = 2.8, 9.4 Hz), 7.52 (1H, m), 7.20 (1H, dd, *J* = 5.3, 8.7 Hz), 4.98 (2H, s), 3.86 (3H, s), 1.38 (s, 18H) ppm.

Step 3: Preparation of tert-butyl 4-fluoro-2-[(methylamino)-carbonyl]benzylcarbamate

A solution of methyl 2-[[bis(*tert*-butoxycarbonyl)amino]methyl]-5-fluorobenzoate (5.0g, 13.04 mmol) in toluene (40 mL) was treated with methylamine gas at -78°C until the solution was saturated. The reaction contents were then placed into a steel bomb and heated to 70°C overnight. After cooling, the reaction was concentrated and then the solids were triturated with ether. The resulting solids were collected by vacuum filtration. As a result of the relatively harsh reaction conditions one of the *t*-butoxycarbonyl protecting groups was removed from the molecule.

¹H NMR (CDCl₃, 400 MHz) δ 7.41 (1H, dd, *J* = 5.6, 8.3 Hz), 7.14-7.06 (2H, m), 6.64 (1H, BS), 5.69 (1H, BS), 4.26 (2H, d, *J* = 6.3 Hz), 2.98 (3H, d, *J* = 4.8 Hz), 1.41 (9H, s) ppm.

Step 4: Preparation of {4-fluoro-2-[(methylamino)carbonyl]phenyl}-methanaminium chloride

A solution of tert-butyl 4-fluoro-2-[(methylamino)carbonyl]-benzylcarbamate (2.59g, 9.17 mmol) in EtOAc (75 mL) was cooled to -78°C . After cooling solids precipitated out of the solution. HCl gas was added to the suspension until it reached saturation at which time the reaction became homogenous. After adding the HCl gas the dry ice bath was replaced with an ice water bath and the reaction was stirred for 10 minutes at 0°C . The solution was concentrated slowly and then redissolved in EtOAc and this was repeated two more times. The resulting solids were then triturated from EtOAc and fluffy white solids were collected by vacuum filtration.

^1H NMR (DMSO, 400 MHz) δ 8.82 (1H, d, $J = 4.2$ Hz), 8.34 (3H, bs), 7.64 (1H, dd, $J = 5.6, 8.5$ Hz), 7.49-7.41 (2H, m), 4.04 (2H, s), 2.80 (3H, d, $J = 4.5$ Hz) ppm.

EXAMPLE 3B

Alternative Preparation of {4-Fluoro-2-[(methylamino)carbonyl]phenyl}-methanaminium chloride

Step 1: Di(tert-butyl) 4-fluoro-2-iodobenzylimidodicarbonate

A solution of 1-(bromomethyl)-4-fluoro-2-iodobenzene (Example 3, step 1) (5g, 15.9 mmol) in dry DMF (50 mL) under argon was cooled to 2°C and treated with NaH (60% dispersion in oil, 0.4g, 17.5 mmol) and stirred for 5 minutes to give a fine slurry. A solution of di-tert-butyl iminodicarboxylate (Aldrich, 3.8g, 17.5 mmol) in 20ml dry DMF was added dropwise, keeping the temperature between 2 and

7°C. After stirring for 1 hr at 0°C, the solution was allowed to warm to room temperature and stirred overnight. The reaction was poured into bicarbonate solution and water was added until all the solids dissolved. The solution was extracted with ether and the combined organic layers were dried over Na₂SO₄, filtered and evaporated and the crude product was purified on 120g silica gel ISCO cartridge eluting first with a gradient of 0-5% EtOAc/Hexanes followed by a gradient of 5-10% EtOAc/Hexanes to give the product as a clear oil that solidified to a white solid.

¹H NMR (CDCl₃, 400 MHz) δ 7.55 (1H, bd, J = 7.3 Hz), 7.03 (2H, m), 4.72 (s, 2H), 1.44 (18H, s).

Step 2: Di(tert-butyl) 4-fluoro-2-[(methylamino)carbonyl]benzyl-imidodicarbonate

The glass reaction vessel from a Parr high pressure apparatus was briefly dried in an oven and di(tert-butyl) 4-fluoro-2-iodobenzylimidodicarbonate (5.17g, 11.5 mmol) was added and dissolved with stirring in 25 mL of dry DMF. Argon was bubbled through the solution while it was cooled to 0°C. Palladium acetate (0.064g, 0.29 mmol), DPPF (0.16g, 0.29 mmol), and diisopropylethylamine (3g, 23 mmol) were added, the flask was tared, and the solution was saturated with methylamine gas (10.5g methylamine, 338.6 mmol). The water condensed on the outside of the reaction vessel was wiped off and the vessel was placed in the Parr high pressure apparatus which was flushed with carbon monoxide gas, then sealed and pressurized to 75 psi carbon monoxide and heated to 70°C internal temperature for 4 hrs. The vessel was cooled and vented and the green solution was poured into water and extracted with ether. The combined ether layers were dried with Na₂SO₄, filtered and evaporated and the residue was chromatographed on a 120g ISCO silica gel cartridge eluting with a gradient of 25-30% EtOAc/Hexanes to give the product as a mixture of mono and bis-tert-butylimidodicarbonate protected material that was taken

onto the next step. A small portion of the mono- and bis tert-butyylimidocarbonate protected products were obtained pure and gave the following NMR.

¹H NMR (CDCl₃, 400 MHz) mono-protected product δ 7.42 (1H, dd, *J* = 5.6, 8.4 Hz), 7.1 (2H, m), 6.47 (1H, bs), 5.7 (1H, bs), 4.27 (2H, d, *J* = 6.4 Hz), 3.0 (3H, d, *J* = 4.9 Hz), 1.40 (9H, s) ppm.

¹H NMR (DMSO-d₆, 400 MHz) bis-protected product δ 8.4 (1H, d, *J* = 4.3 Hz), 7.35-7.2 (2H, m), 7.11 (1H, dd, *J* = 5.5, 8.3 Hz), 4.81 (2H, s), 2.75 (3H, d, *J* = 4.5 Hz), 1.38 (18H, s).

10 Step 3: {4-fluoro-2-[(methylamino)carbonyl]phenyl)methanaminium chloride

A mixture of mono and bis-protected intermediate from the previous step (4.58g, ~ 19 mmol) was dissolved in 200mL EtOAc and cooled to -60°C under argon. The solution was saturated with HCl gas then the flask was transferred to an ice bath and the reaction monitored by HPLC until no starting materials remained. The reaction vessel was placed on a rotoevaporator and the solvent removed carefully under vacuum, first with the flask out of the water bath, then with the flask in room temperature water bath, to give a white solid. This material was resuspended in EtOAc and the solvent removed again under vacuum. The residue was dried under high vacuum overnight, then suspended in ether and filtered to give the final product as a white solid.

¹H NMR (DMSO-d₆, 400 MHz) δ 8.8 (1H, bs), 8.22 (3H, bs), 7.61 (1H, dd, *J* = 5.6, 8.4 Hz), 7.45 (2H, m), 4.04 (2H, s), 2.80 (3H, d, *J* = 4.5 Hz) ppm.

(54) Title: N-(SUBSTITUTED BENZYL)-8-HYDROXY-1,6-NAPHTHYRIDINE-7- CARBOXAMIDES USEFUL AS HIV INTEGRASE INHIBITORS

(57) Abstract: N-(Substituted benzyl)-8-hydroxy-1,6-naphthyridine-7-carboxamides are inhibitors of HIV integrase and inhibitors of HIV replication. The naphthyridine carboxamides are of Formula (I): wherein R^{1'}, R^{2'} and R^{3'} are defined herein. The compounds are useful in the prevention and treatment of infection by HIV and in the prevention, delay in the onset, and treatment of AIDS. The compounds are employed against HIV infection and AIDS as compounds per se or in the form of pharmaceutically acceptable salts. The compounds

and their salts can be employed as ingredients in pharmaceutical compositions, optionally in combination with other antivirals, immunomodulators, antibiotics or vaccines. Methods of preventing, treating or delaying the onset of AIDS and methods of preventing or treating infection by HIV are described.
